Etienne-Toumelin I., Sirard J., Duflot E., Mock M., Fouet A.
"Characterization of the Bacillus anthracis S-layer: cloning
sequencing of the structural gene.";
J. Bacteriol. 177:614-620(1995).
-i- FUNCTION: The S-layer is a paracrystalline mono-layered
of proteins which coat the surface of bacteria.
-i- SUBCELLULAR LOCATION: Cell wall.
-i- PTM: PROBABLY GLYCOSYLATED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-FEB-1996 (Rel. 33, Created)

-!- CATALYTIC ACTIVITY: ATP + 2-(formamido)-N(1)-(5-phospho-D-ribosyl)acetamidine = ADP + phosphate + 5-amino-1-(5-phospho-D-ribosyl)imidazole.
-!- PATHWAY: De novo purine biosynthesis; fifth step.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

Biol. Chem. 265:20390-20393(1990).

-I-FUNCTION: Subunit of the peripheral VI complex of vacuolar ATP:
Subunit C is necessary for the assembly of the catalytic sector
the enzyme and is likely to have a specific function in its
catalytic activity. V-ATPase is responsible for acidifying a
variety of intracellular compartments in eukaryotic cells.
-I-CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
H(+)(Out).

BUBUNIT: V-ATPase is an heteromultimeric enzyme composed of a
peripheral catalytic VI complex (components A to H) attached to
an integral membrane V0 proton pore complex (components: a, c, c, c, and d).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MIM, 603097; -.

-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the EPSP synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          "The genome sequence of the food-borne pathogen Campylobacter jejuni reveals hypervariable sequences.";
Nature 403:665-668(2000).
-i- CATALYTIC ACTIVITY: Phosphoenolpyruvate + 3-phosphoshikimate = phosphate + 5-0-(1-carboxyvinyl)-3-phosphoshikimate.
-i- PATHWAY: Aromatic amino acids biosynthesis; shikimate pathway;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AROA CAMJE STANDARD; PRT; 428 AA.

A Shimoi H., Tadenuma M.;

AT "Characterization of Rarobacter faecitabidus protease I, a "Characterization of Farobacter faecitabidus de la civity.";

RT yeast-lytic serine protease having mannose-binding activity.";

RL J. Biochem. 110:608-613(1991).

CC -!- FUNCTION: MAJOR SERINE PROTEASE EXHIBITING LYTIC ACTIVITY TOWARD CIVING YEAST CELLS. SIMILAR TO ELASTASE IN ITS SUBSTRATE CONTINUE YEAST CELLS. SIMILAR TO ELASTASE IN TS SUBSTRATE CONTINUE SPECIFICITY AND HAS A LECTIN-LIKE AFFINITY FOR MANNOSE.

CC SPECIFICITY AND HAS A LECTIN-LIKE AFFINITY FOR MANNOSE.

CC MANNOPROTEINS MAY BE THE NATIVE SUBSTRATE FOR RPI.

CC SUBCELLULAR LOCATION: Secreted.

CC -!- SIMILARITY: Contains 1 ricin B-type lectin domain.

CC -!- SIMILARITY: Contains 1 ricin B-type lectin domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sixth step.
-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the EPSP synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nature 392:353-358(1998).

- CATALYTIC ACTIVITY: Phosphoenolpyruvate + 3-phosphoshikimate = phosphate + 5-0-(1-carboxyvinyl)-3-phosphoshikimate.

-!- PATHWAY: Aromatic amino acids biosynthesis; shikimate pathway;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              77 MPNSAVSK------GE-----LDANAMOH------KPYLEKDSQEKGLNNLVI 112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .57; Conservative

THE FLAGELLAR FILAMENT BY FACILITATING POLYMERIZATION OF THE PLAGELLIN MONOWERS AT THE TIP OF GROWING FLAMENT, FORMS A CAPE STRUCTURE, WHICH PREVENTS PLAGELLIN SUBUNITS (FRANESTED THROUT THE CENTRAL CHANNEL OF THE FLAGELLIN) FROM LEAKING OUT WITHOUT POLYMERIZATION AT THE DISTAL END. ESSENTIAL TO COLONIZE AND ESTABLISH INFECTION IN GASTRIC MUCOSA AS A RESULT OF ITS ESSENT ROLE IN MOTILITY, HAS EFFECT ON FLAA GENE TRANSCRIPTION.

SUBUNIT: HOMOGENEAMER (By Similarity).

SUBULILILAR LOCATION: Flagellar.

"oDNA sequences for mouse vacuolar ATPase subunits.";
Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.
-i-FUNCTION: Subunit of the peripheral VI complex of vacuolar ATPase.
Subunit C is necessary for the assembly of the catalytic sector of the enzyme and is likely to have a specific function in its catalytic activity. V-ATPase is responsible for acidifying a variety of intracellular compartments in eukaryotic cells.
-i- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                         MGD; MGI:1913585; Atp6v1c1.
